Life expectancy of Japan

2000 years' ago: life expectancy was 24 years old.

1950 : life expectancy was about 54-55 years' old
Retirement age was 50

2018: Retirement age, 60-65

Life Expectancy of ladies: 87 years old

men: 81 years old

Election: Average age of voters, 57 years old

Figure 1: Old-Age Dependency Ratios (%)

Break-Even Inflation Rates

(Until 31 August 2019)

Note: BEI (Japan: 10 year) is calculated based on the compound interest rate of the new Inflation-Indexed Bonds and the 10-Year Bonds

Declined effectiveness of fiscal and monetary policies faced with aging population in Japan[☆]

Naoyuki Yoshino^a, Hiroaki Miyamoto^{b,*}

^a *Asian Development Bank Institute, Japan*

^b *International Monetary Fund, United States*

Household's problem

- Worker's problem:

$$\max \mathbb{E}_0 \sum_{t=0}^{\infty} \beta^t \left\{ \frac{1}{1-\sigma} \left[\left\{ \omega c_{w,t}^{\frac{\zeta-1}{\zeta}} + (1-\omega) g_t^{\frac{\zeta-1}{\zeta}} \right\}^{\frac{\zeta}{\zeta-1}} \right]^{1-\sigma} + \frac{m_{w,t}^{1-\gamma}}{1-\gamma} - \frac{h_{w,t}^{1+\mu}}{1+\mu} \right\}$$

$$\text{s.t. } c_{w,t} + k_{w,t} + m_{w,t} + b_{w,t} = w_t h_{w,t} + r_{k,t} k_{w,t-1} + (1-\delta) k_{w,t-1} \\ + R_{t-1} \frac{b_{w,t-1}}{\pi_t} + \frac{m_{w,t-1}}{\pi_t} + d_{w,t} - \tau_{w,t}$$

- Retiree's problem:

$$c_{r,t} = S.$$

(a) Effects of an expansionary monetary policy

(b) Effects of a positive government investment shock

Effects of Expansional Monetary Policy

Monetary Policy (Working Population)

- Increase investment
- Wages of working population will rise
- Consumption of working population will rise

(Retired Population)

- relies on pensions and social welfare
- monetary policy does not affect to retirees

Effects of Fiscal Policy (Public Works)

Fiscal Policy (Working Population)

- Create new jobs**
- Unemployment rate declines**
- Consumption of working population will rise**

Retired population

- Not affected by fiscal policy (punli**
- consumption remains the same**
- lower interest rate reduces their interest income**

Empirics – Miyamoto and Yoshino (2019)

- Specification 1

$$y_{i,t+k} - y_{i,t} = \alpha_i^k + \gamma_t^k + \beta^k \text{shock}_{i,t} + \varepsilon_{i,t}^k$$

- y : log of output (debt-to-GDP ratio, private-investment-output ratio)
- shock : an unanticipated public investment shock
- α : country fixed effects
- γ : time fixed effects

- Specification 2

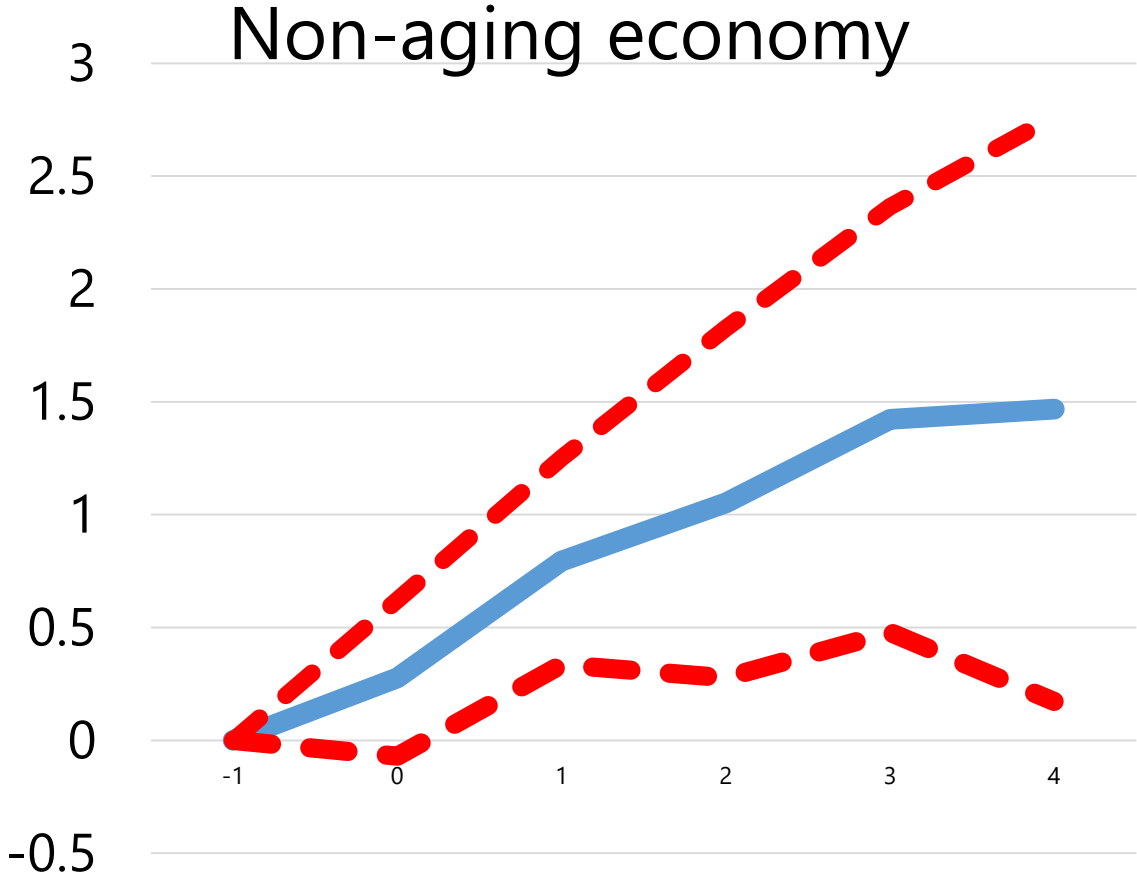

$$y_{i,t+k} - y_{i,t} = \alpha_i^k + \gamma_t^k + \beta_1^k G(z_{i,t}) \text{shock}_{i,t} + \beta_2^k (1 - G(z_{i,t})) \text{shock}_{i,t}$$

with

$$G(z_{i,t}) = \frac{\exp(-\delta z_{it})}{1 + \exp(-\delta z_{it})}, \delta > 0$$

where δ is an indicator of public investment efficiency

Impact of Fiscal Policy (Public Investment)

Recommended Policy

Productivity based wage rate and postpone retirement age

TAX Burden of Young ↓

Consumption of Old ↑
